UniProt\_03:\*
1: uniprot\_sprot:\*
2: uniprot\_trembl:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C -!- FUNCTION: pH-dependent, voltage-insensitive, background potassium channel protein. Rectification direction results from potassium ion concentration on either side of the membrane. Acts as an outward rectifier when external potassium concentration is low.

When external potassium concentration is high, current is inward (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

Low levels in liver, kidney and skeletal muscle.
MISCELLANEOUS: Inhibited by extracellular acidification, zing bupivacaine and phenytoin. Activated by protein kinase A. SIMILARITY: Belongs to the two pore domain potassium channel (TC 1.A.1.8) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

Pflugers Arch. 442:828-833(2001).

-!- FUNCTION: pH-dependent, voltage-insensitive, background potassium channel protein. Rectification direction results from potassium ion concentration on either side of the membrane. Acts as an outward rectifier when external potassium concentration is low.

When external potassium concentration is high, current is inward.

When external potassium concentration is high, current is inward.

-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

-!- TISSUE SPECIFICITY: Widespread expression in adult. Strongest expression in pancreas and placenta. Lower expression in brain, lung, prostate, heart, kidney, uterus, small intestine and colon.

-!- MISCELLANEOUS: Inhibited by external acidification. Activated by halothane and isoflurane.

-!- SIMILARITY: Belongs to the two pore domain potassium channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

Neurophysiol. 86:130-142(2001).

FUNCTION: pH-dependent, voltage-insensitive, background potage channel protein.

SUBCELLULAR LOCATION: Integral membrane protein (Potential).

TISSUE SPECIFICITY: Mainly found in the cerebellum. Also foun adrenal gland, kidney and lung.

MISCELLANEOUS: Inhibited by phorbol 12-myristate 13-acetate Insensitive to changes in the pH range of 7-8.

Insensitive to changes in the pH range of 7-8.

(TC 1.A.1.8) family.

Neurosci. 18:632-648(2001).

FUNCTION: pH-dependent, voltage-insensitive, background potassium channel protein.

SUBCELLULAR LOCATION: Integral membrane protein (Potential).

TISSUE SPECIFICITY: Expressed in the CNS but not in heart, lung, liver, kidney, intestine and skeletal muscle. The highest expression was found in the olfactory nuclei, piriform cortex, cerebellum, antedorsal thalmic nucleus, pontine nucleus, dorsal raphe and several nuclei in the medulla. Shows a non-homogeneous distribution in the hippocampus. Expressed at highest levels in the lateral posterior and inferior portions and at medium levels

          activity
FUNCTION: Probable potassium channel subunit. No channel activity observed in heterologous systems. May need to associate with another protein to form a functional channel.
SUBUNIT: Heterodimer (Potential).
SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Brain-specific. Highly expressed in auditory nuclei, in Purkinje cells and in olfactory bulb mitral cells.
PTM: Phosphorylated (Potential).
SIMILARITY: Belongs to the two pore domain potassium channel (TC 1.A.1.8) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

-!- FUNCTION: Probable potassium channel subunit. No channel activit observed in heterologous systems. May need to associate with another protein to form a functional channel.

-!- SUBUNIT: Heterodimer (Potential).

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- TISSUE SPECIFICITY: Detected in pancreas, heart, placenta, lung,

K+ channel), a member of a new family of 2P domain potassium channels, also including human TWIK-1 (see AAY79673), human TASK1 (see AAY79674) and novel human TASK2 (see AAY79675). Human and mouse TASK proteins share 85% identity, indicating that they are products of orthologue genes. Host cells expressing TWIK-1 family members can be used to screen for substances that modulate the activity of members of the TWIK-1 family of potassium channels. The drugs identified may be useful in the treatment of diseases of the heart or of the nervous system, such as epilepsy, arrhythmia, vascular diseases, neurodegenerative diseases, kidney, liver or pancreas diseases, hypertension, diseases associated with ischaemia or anoxia, endocrine diseases associated with anomalies of hormone secretion, and muscle diseases
                                                                                                                                                                                                                                      0

The invention relates to TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel family (ICF) nucleic acids and proteins. The TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ICF nucleic acids and proteins may be used for preventing, diagnosing and treating ICF-related diseases. The sequences may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of ICF proteins by expressing inactive proteins or complement the ICF proteins of ICF proteins of ICF proteins and in assays to identify modulators of ICF protein expression and activity. The antipodies in antibodies, agonists and antagonists may be used to anti-ICF protein antibodies, agonists and antagonists may be used to used as diagnostic agents for detecting the presence of ICF proteins in samples (e.g. by immunoassay). The nucleic acids and proteins may be used to prevent, diagnose and treat a wide variety of disorders, e.g. cancers and leukaemia, Alzheimer's disease, Parkinson's disease, multiple caleragenere represents a rat protein used in the scope of the invention.

Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human and mouse TREK-1 potassium channel proteins and their corresponding DNA molecules. TREK-1 nucleic acid is useful for transfecting cells to induce expression of the TREK-1 potassium channel protein. These cells are then used in assays to identify compounds which have anaesthetic properties, producing a safe, reversible state of unconsciousness with concurrent amnesia and analgesia in a mammal upon inhalation. The present sequence is murine TASK potassium channel protein related to the invention

                                       The present sequence is that of human TASK1 (TWIK-related acid-sensitive K+ channel), a member of a new family of 2P domain potassium channels, also including TWIK-1 (see AAY79673) and novel TASK2 (see AAY79675).

TASK1 is expressed in many different tissues, and at particularly high levels in pancreas and placenta. Host cells expressing TWIK-1 family members can be used to screen for substances that modulate the activity of members of the TWIK-1 family of potassium channels. The drugs identified may be useful in the treatment of diseases of the heart or of the nervous system, such as epilepsy, arrhythmia, vascular diseases, neurodegenerative diseases, kidney, liver or pancreas diseases, hypertension, diseases associated with ischaemia or anoxia, endocrine diseases associated with anomalies of hormone secretion, and muscle

human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, reproductive or developmental disorders, (e.g. arteriosclerosis, reproductive or developmental disorders, (e.g. arteriosclerosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, asthma, Crohn's disease, Microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP uncleic acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for detecting HSPP in standard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapy, as antisense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP and antisense, or monitor, HSPP related diseases (in usual immunoassays), as therapeutic antisolists, in competitive drug screens, and for purification of HSPP from natural

family (ICF) nucleic acids and proteins. The TWIK-6, TWIK-7, IC23927,
TWIK-8, IC47611, IC47615, HNWDA-1, TWIK-9, alpha-2delta-4, 54414 and
53763 ICF nucleic acids and proteins may be used for preventing,
diagnosing and treating ICF-related diseases. The sequences may be used
to treat disorders associated with decreased expression by rectifying
mutations or deletions in a patient's genome that affect the activity of
ICF proteins by expressing inactive proteins or to supplement the
ICF proteins by expressing inactive proteins may also be used as antigens in the production of ICF proteins. The proteins may also be used to antigens in the production of ICF protein expression and activity. The anti-ICF protein antibodies, agonists and antagonists may be used to regulate ICF protein antibodies, agonists and antagonists may be used to regulate ICF protein expression and activity. The antibodies may also be
cused as diagnostic agents for detecting the presence of ICF proteins in
samples (e.g. by immunoassay). The nucleic acids and proteins may be used
to prevent, diagnose and treat a wide variety of disorders, e.g. cancers
and leukaemia, Alzheimer's disease, Parkinson's disease, multiple
sclerosis, epilepsy, hepatic disorders and cardiovascular disorders. This
sequence represents a human protein used in the scope of the invention.
Note: The sequence data for this patent is also available in electronic
format from USPTO at seqdata.uspto.gov/sequence.html.

IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel
family (ICF) nucleic acids and proteins. The TWIK-6, TWIK-7, IC23927,

TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and
C fagnosing and treating ICF-related diseases. The sequences may be used
diagnosing and treating ICF-related diseases. The sequences may be used
to treat disorders associated with decreased expression by rectifying
mutations or deletions in a patient's genome that affect the activity of
ICF proteins by expressing inactive proteins or to supplement the
C ICF proteins by expressing inactive proteins may also be used as
antigens in the production of antibodies against ICF proteins and in
assays to identify modulators of ICF protein expression and activity. The
antigens in the production of antibodies against ICF proteins and in
c regulate ICF protein expression and activity. The antibodies may be used
to prevent, disgnose and treat a wide variety of disorders, e.g. cancers
and leukaemia, Alzheimer's disease, Parkinson's disease, multiple
c sequence represents a human protein used in the scope of the invention.

The invention relates to TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel family (ICF) nucleic acids and proteins. The TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ICF nucleic acids and proteins may be used for preventing, diagnosing and treating ICF-related diseases. The sequences may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of ICF proteins by expressing inactive proteins or coupplement the contigens in the production of antibodies against ICF proteins and in assays to identify modulators of ICF protein expression and activity. The antibodies in the protein antibodies, agonists and antagonists may be used to anti-ICF protein antibodies, agonists and antagonists may be used to regulate ICF protein expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of ICF proteins in samples (e.g. by immunoassay). The nucleic acids and proteins may be used to prevent, diagnose and treat a wide variety of disorders, e.g. cancers and leukaemia, Alzheimer's disease, Parkinson's disease, multiple and leukaemia, Alzheimer's disease, Parkinson's disease, multiple sequence represents a human protein used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.ttml.
                                                                                                         and
                                                                            ful for
disease
                                                                        acids and proteins, use J. cancers, Alzheimer's
                                                    IC47615, HNMDA-1,
                                                TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, alpha2delta-4, 54414, or 53763 nucleic aci preventing, diagnosing and treating e.g. ccardiovascular disorders.

improving n ion channel protein for conditions. a mutant potassium flux under acidic c New polypeptide, inward potassium

Example 18; Page 53; 131pp; English

in The invention relates to a mutant potassium ion channel protein, having four membrane spanning domains and two pore forming domains, comprising a mutation at the second pore forming domain. The expression of the mutant protein in a cell confers improved inward potassium flux and the ability to grow in the presence of potassium. Mutant proteins and their corresponding polynucleotide sequences can therefore be used to improve inward potassium flux into cells under acidic conditions by modulating the membrane potential using therapeutic agents. The sequences may be used to develop agonists and antagonists of potassium channel proteins in order to control pests such as nematodes and insects. This sequence represents a mouse 2P channel protein

                                                                                                                                                                                                                                                                                                                                The present sequence represents human DKCN1 polypeptide. The polype is a member of the potassium channel family. The DKCN1 polypeptides polynucleotides are useful for treating diseases including cancer, pulmonary, cardiovascular, inflammatory or renal diseases, pain, psychiatric disorders including depression and schizophrenia, neurodegenerative disease including Alzheimer's, neurological disormigraine, epilepsy, sleep-related disorders, erectile dysfunction alopecia. DKCN1 polynucleotides are useful as diagnostic reagents alopecia, mutations in the associated gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is encoded by an expressed sequence tag (EST) which is related to a cDNA encoding a human DKCN1 polypeptide. The polypeptide is a member of the potassium channel family. The DKCN1 polypeptides and polynucleotides are useful for treating diseases including cancer, pulmonary, cardiovascular, inflammatory or renal diseases, pain, psychiatric disorders including depression and schizophrenia, neurodegenerative disease including Alzheimer's, neurological disorders, migraine, epilepsy, sleep-related disorders, erectile dysfunction and alopecia. DKCN1 polynucleotides are useful as diagnostic reagents for detecting mutations in the associated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  63

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a human potassium channel protein, KCNB. KCNB is expressed in breast tissue. The KCNB polypeptides are useful for identifying a compound that modulates its activity. The polypeptide and nucleic acid are useful for detecting cancer cells biological samples. The inhibitor of the potassium channel polypeptuseful for inhibiting proliferation of a cancer cell and for treat potassium channel-associated disorder. The KCNB nucleic acids, proland/or antibodies are useful in the diagnosis or prognosis, or treating and/or antibodies.
                                                                                                                                                                                                                                                                                          405
